-I- FUNCTION: Type I collagen is a member of group I collagen
(fibrillar forming collagen).
-I- SUBUNI: Trimers of one alpha 2(I) and two alpha 1(I) chains.
-I- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and
bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                            PTM: Proline residues at the third position of the tripeptide repeating unit. (G-X-Y) are hydroxylated in some or all of the chains. Pro-1153 is the only 3-hydroxypro and the only hydroxylated proline in position. SIMILARITY: Contains 1 VWPC domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probom, PD000007; Clg helix; 2.

-!- FUNCTION: Collagen type II is specific for cartilaginous tissues.

-!- FUNCTION: Collagen type II is specific for cartilaginous tissues.

-!- FUNCTION: Collagen type II is specific for cartilaginous tissues.

-!- FUNCTION: Collagen type II is specific for cartilaginous tissues.

-!- FTM: Proline residues at the third position of the tripeptide repeating unit (G.X-Y) are hydroxylated in some or all of the chains. Hydroxylation on Pro-9 is involved in cross-linking.

-!- FTM: O-linked glycans consist of Glc-Gal disaccharides bound to the oxygen atom of post-translationally added hydroxyl groups.

-1- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.
-1- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE OF 295-562.

                 -!- FTM: O-linked glycan consists of a Glc-Gal disaccharide bound to
the oxygen atom of a post-translationally added hydroxyl group.
-!- MISCELLANEOUS: The complete chain contains 1052 residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TISSUE=Kidney;

Nucleic Acids Res. 11:2733-2744(1983).

-!- FUNCTION: Collagen type III occurs in most soft connective tissues along with type I collagen.

-!- SUBBUIT Trimers of identical alpha 1(III) chains. The chains are linked to each other by interchain disulfide bonds. Trimers are also cross-linked via hydroxylysines.

-!- FUNT Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SIMILARITY).

"The order of the CNBr peptides from the alpha 2 chain of collagen.";

Biochem. Biophys. Res. Commun. 38:703-708 (1970).

-! FUNCTION: Type I collagen is a member of group I collagen

(fibrillar forming collagen).

-!- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-!- SUBUNIT: Trimers of one alpha 2(I) and two alpha 1(I) chains.

-!- TISSUE SPECIFICITY: Forms the fibrils of tendon, ligaments and bones. In bones the fibrils are mineralized with calcium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            MEDLINE=75059250; PubMed=4435743;

Collagen alpha 1(II) chain precursor [imported] - horse

N.Alternate names: type II collagen

N.Alternate names: type II collagen

C.Species: Equae caballus (domestic horse)

C.Accession: T45467

R.Richardson, D.W.; Dodge, G.R.

R.Richardson, D.W.; Dodge, G.R.

Submitted to the EMBL Data Library, June 1996

A.Description: Cloning of equine type II collagen and modulation of its expression in equal parameter and modulation of its expression in equal parameter and modulation of its expression in equal parameter in the state of translated from GB/EMBL/DDBJ

A.Reference number: 222977

A.Residues: preliminary; translated from GB/EMBL/DDBJ

A.Molecule type: mRNA

A.Molecule type: mRNA

A.Residues: 1-1418 - RIC>

A.Residues: 1-1418 - RIC>
